

How to setup your DataBase and API application to be ready for Run

- 1- In this application I used **Visual studio with .NET 8** web api application , **MS SQL Server in Windows Operating System** , **Entity Framework Core** **Swagger** and **JUnit Package for UnitTest**
- 2- I **Configure Program.cs using the Minimal Hosting Model** without requiring Startup.cs.
- 3- I used MS SQL Server in Windows Operating System .
- 4- My connection was Windows Authentication (I suggest to do like me).
- 5- To Set your Data Base Connection.
- 6- Go to (Paysky Backend Technical Task(Ahmed Bassem Ramzy)\Bank-System\Bank-System-PaySky).
- 7- Open appsettings.json.
- 8- If you will use Windows Authentication you should replace [Enter your server name here] To your server name like that in the second photo.

```
"ConnectionStrings": {  
  "DefaultConnection": "Server=[Enter your server name here];Database=BankingSystem;Trusted_Connection=True;Encrypt=False;",  
  "TestDB": "Server=[Enter your server name here];Database=TESTDB;Trusted_Connection=True;Encrypt=False;"  
}
```

- 9- You also can use user name and password but you will need to update the Connection String

Like

```
"ConnectionStrings": { "DefaultConnection":  
"Server=YOUR_SERVER_NAME;Database=BankingSystem;UserId=YOUR_USERNAME;  
Password=YOUR_PASSWORD;" }
```

- 10- After setup your Database connection We need to add EF core Migration I already add EF Core Package to the project

- 1- Microsoft.EntityFrameworkCore.Sqlserver(9.0.0)
- 2- Microsoft.EntityFrameworkCore.Tools(9.0.0)
- 3- Microsoft.EntityFrameworkCore.Design(9.0.0)
- 4- Microsoft.EntityFrameworkCore.InMemory(9.0.0)

You just need after open Visual Studio to go to Tools -> NuGet Package Manager -> Package Manager console

This will open you console to controle Migration.

First write ->> **add-migration [custom migration name]**.

Second write ->> **update-database**.

This will apply the Data layer and DbContext and create Database called **BankingSystem** With all relations and tables.

Than you can run the application.

HOW TO USE Unit Test

For Unit Test I create Separated Application in The Scope of Bank-System Solution

And download **NUnit Package** in both UnitTest app and Bank-System-PaySky app

To run the UnitTest go to application must be build before than got to

Test → Test Explorer → run all tests.
